# NAVIGATION

AND

# NAUTICAL ASTRONOMY.

[*Price One Guinea in Sheets.*]

# A COMPLETE COLLECTION

OF

# TABLES

FOR

# *NAVIGATION*

AND

# *NAUTICAL ASTRONOMY.*

WITH

SIMPLE, CONCISE, AND ACCURATE METHODS, FOR ALL THE CALCULATIONS USEFUL AT SEA;

PARTICULARLY FOR DEDUCING THE LONGITUDE FROM LUNAR DISTANCES, AND THE LATITUDE FROM TWO ALTITUDES OF THE SUN AND THE INTERVAL OF TIME BETWEEN THE OBSERVATIONS.

141454

BY

*JOSEPH DE MENDOZA RIOS, ESQ. F.R.S.*

LONDON:

PRINTED BY T. BENSLEY, BOLT-COURT.

SOLD BY R. FAULDER, NEW BOND-STREET; LONGMAN, HURST, REES, AND ORME, PATERNOSTER-ROW; BLACKS AND PARRY; AND W. HEATHER, LEADENHALL-STREET; AND PAYNE AND MACKINLAY, STRAND.

1805.

TO

THE RIGHT HONOURABLE

# Sir JOSEPH BANKS, Baronet, K.B.

*President of the Royal Society, &c. &c.*

SIR,

THE veneration I entertain for you, whoſe life has been ſo ſucceſsfully devoted to the cultivation and promotion of ſcience, and the gratitude I feel for the regard with which you honour me, would alone incline me to ſeize every opportunity of publicly teſtifying to you thoſe ſentiments; but, on the preſent occaſion, I am impelled to addreſs you by ſtill more cogent motives. While I eſteem your approbation as one of the moſt valuable rewards of my labour, it is at the ſame time incumbent on me to declare, that Navigators will be indebted to you, for a conſiderable ſhare of any benefit they may derive from the methods offered to their uſe in the following [illegible]. The warm intereſt you manifeſted in my undertaking, has ſtimulated my diligence, and ſupported my induſtry, to the completion of this toilſome compoſition; and you have made every effort in your power to promote the utility of my performance, by facilitating its introduction in practice. Should

this work meet with a favourable reception from the Public, the idea of its having juſtified in any degree your good opinion, will be to me a peculiar ſatisfaction: but my obligations to you are not to be affected by the merit or demerit of my book, or by the fate which may attend it; and I diſcharge a pleaſing duty, while I thus preſent it to you, with my ſincere acknowledgements for the many marks of friendſhip which I have experienced from you on various occaſions.

I requeſt you to accept them, as the genuine effuſions of that warm attachment and high reſpect, with which I have the honour to remain,

SIR,

Your moſt devoted and obliged ſervant,

Portman-Place,
N. [illegible]

JOSEPH DE MENDOZA RIOS.

I HEREWITH offer to the Public, a Collection of Tables, which I announced ſome time ſince, and which I have endeavoured to render as convenient and uſeful as appears to me requiſite for the uſual calculations of Navigation and Nautical Aſtronomy.

The expences attending this work are ſuch, that, had it been publiſhed in the uſual manner, the price of the book muſt have been ſo high as to confine its utility ſolely to that claſs of Navigators who are in eaſy circumſtances; and which, unfortunately, is not the moſt numerous. But the Commiſſioners of Longitude have remedied this diſadvantage, by granting a ſum of money to reduce the price to the Public; and I here preſent my moſt reſpectful thanks to them, for this honourable teſtimony of their approbation of my labours.

The Court of Directors of the Eaſt India Company, whoſe liberality with regard to ſcience in general, and particularly that of Navigation, is ſo well known, have alſo voted a ſum of money, to effect a farther reduction in the price of this work; for which I likewiſe preſent to them my beſt acknowledgements.

With this double aſſiſtance, and the additional ſacrifice, on my part, of all views of profit, I have ſettled the ſale of this edition on the moderate terms at which it is now publiſhed; and, I ſhall eſteem myſelf happy, if my endeavours to bring theſe tables before the Public, in the moſt likely manner to prove uſeful, ſhould contribute in any degree to improve and diffuſe the practice of Nautical Aſtronomy.

TABLES

# EXPLANATION AND USE

OF THE

# TABLES;

WITH

## PROBLEMS AND EXAMPLES.

# EXPLANATION OF THE TABLES.

PREVIOUS to the Explanations of the ſeveral Tables, I ſhall make the following general Remarks:

As the minutes and ſeconds of the circle differ ſo much from the minutes and ſeconds of time, I have thought proper to diſtinguiſh them by different marks, or ſigns; which will, I hope, produce perſpicuity and prevent miſtakes. I have, therefore, adopted for the latter the initial letters of the words; an $^{m}$ will accordingly be found to mark the minutes of time, and an $^{s}$ to denote the ſeconds, &c., in the ſame manner as we uſe an $^{h}$ to mark the hours; leaving the ſigns $^{\circ}$, $'$, $''$, &c. excluſively, for the expreſſions which apply to the diviſions of the circle.

When a C is placed before the Roman numbers of the tables, it is intended to ſignify, that the page, thus marked, is a continuation of the ſubject, or table, contained in the preceding pages.

Except when the contrary is expreſſed, I always uſe aſtronomical time in conformity with the Nautical Almanac, ſuppoſing the day to begin at noon (twelve hours later than the civil day), and counting it up to twenty-four hours, or till the ſucceeding noon.

When I expreſs the ſhip's longitude, I underſtand that it is reckoned from the meridian of the Royal Obſervatory at Greenwich.

## TABLE I.

*Corrections to be applied to the Angles, on Account of the Deviation of the Plane in which they were obſerved.*

The teleſcope, in Hadley's Quadrant, or the Reflecting Circle, is ſo ſituated as to preſerve its parallelism to the plane of the inſtrument; but, ſometimes, the contact of the images cannot be obſerved through the axis of viſion; that is, in the center of the object glaſs. In theſe caſes, the deviation of the line of ſight may be meaſured or eſtimated; for which the preſent table will give the correction, to be ſubtracted from the obſerved angle, in order to have the true angle.

## TABLE II.

*Depreſſions, or Dips of the Horizon of the Sea.*

This table contains the difference in the ſituations of the true horizon and the viſible horizon of the ſea, according to the height of the obſerver's eye above the water; allowance being made for the effect of horizontal refraction. The Dip is to be ſubtracted from the Altitudes taken at ſea with Hadley's Quadrant, except when the back obſervation is uſed, in which caſe the Dip muſt be added.

## TABLE III.

*Dips of the Sea, at different Diſtances from the Obſerver.*

When the land intervenes, and obſtructs the ſight of the horizon under the ſun's vertical, the Dip of the ſea at that place may be found by the preſent table, according to the diſtance from the obſerver to the point uſed as horizon in bringing the reflected image for taking the Altitude. Seamen, by habit, are frequently able to eſtimate ſuch diſtances, with ſufficient accuracy for that purpoſe; if not, the Dip may be aſcertained by the following method:

Let two perſons obſerve the ſun's altitude at the ſame time; the one as high up the main, or fore maſt, as he can conveniently place himſelf, and the other on deck immediately underneath; and let the height of each obſerver's eye above the ſea be meaſured. Multiply the difference (in minutes) of the obſerved altitudes, by the leſſer height (in feet); and divide the product by the difference of the two heights (in feet), which will give a firſt quotient. Multiply the difference of the two heights by the conſtant number 0,283; and divide the product by the difference of the altitudes; which will give a ſecond quotient. The ſum of the two quotients will be the Dip (in minutes), anſwering to the ſituation of the lower obſerver, or that which is to be applied to the leſſer obſerved altitude.

By uſing the greater height in the above calculation, the reſult will be the Dip for that height, or for the greater altitude.

EXAMPLE.

An obſerver at the maſt head, having his eye 91 feet above the ſea, took, with Hadley's Quadrant, the ſun's altitude, and found it to be 41°. 37′; while another obſerver on deck, with his eye 22 feet above the ſea, found the ſun's altitude to be 41°. 25′. Therefore,

| | Feet | | | | |
|---|---|---|---|---|---|
| Height at the maſt head - | 91 | Diff. 69 | Obſerved altitude - | 41°. 37′ | Diff. 12 |
| Height on deck - - - | 22 | | Obſerved altitude - | 41. 25 | |
| First quotient $\frac{12' \times 22}{69}$ | = 3′,8 | | | | |
| Second quotient $\frac{69' \times 0{,}283}{12}$ | = 1′,6 | | Dip on deck - - | — | 5 |
| Sun's altitude on deck corrected of Dip - - - - - - | | | | | 41. 20 |

The Dip at the maſt head would be found to be 15′,8 + 1′,6 = 17′.

## TABLE IV.

*Corrections (ſubtractive) of the Apparent Altitudes of the Sun, and Stars.*

By an effect of the refraction which the rays of light ſuffer in their paſſage through our atmoſphere, the heavenly bodies appear higher than they really are, by a quantity, which is at its maximum at the horizon, and gradually decreaſes till it vaniſhes at the zenith. The preſent table gives the corrections which muſt, on this account, be ſubtracted from the obſerved altitudes of the ſtars.

The

The parallax of the ſun diminiſhes the effect of the refraction, and the difference is here given for applying, at once, the reſult of both corrections to the ſun's altitude.

The corrections are found at ſight in this table to the neareſt ſecond, in a manner which is evident, and of which many examples will be given hereafter.

## TABLE V.

*Numbers for reducing the Mean Refractions of the Nautical Tables to the actual weight and temperature of the Atmoſphere*.*

The mean refractions given in Table IV. are computed for that ſtate of the atmoſphere when the Barometer is at 29,6 inches, and Fahrenheit's Thermometer at 50 degrees. In order to adapt them to any other weight and temperature, the numbers of this table, anſwering to the given height of the Barometer, and the degrees of the Thermometer, muſt be multiplied by the mean refraction; and the product will be the actual refraction.

In correcting the low altitudes, it will always be proper to attend to the actual weight and temperature of the atmoſphere, uſing the Barometer and Thermometer, or a ſingle inſtrument anſwering the purpoſes of both. But in the altitudes of the Moon care muſt be taken to multiply the number of this table only by the refraction, and not by the correction of the Moon's altitude contained in Table IX. which comprehends both refraction and parallax.

## TABLE VI.

*Complementary Corrections (additive) of the Apparent Altitudes of the Sun and Stars.*

This table is arranged in the ſame manner as Table IV. and requires no farther explanation.

## TABLE VII.

*Semidiameters of the Moon in Altitude.*

The Nautical Almanac gives the Moon's horizontal ſemidiameter, with which, and the given apparent altitude, the ſemidiameter in altitude may be found at ſight in this table. It will be ſufficient to look for the column of the horizontal ſemidiameter, reſerving the units of the given ſeconds, and to take the number of the table anſwering to the argument neareſt the given apparent altitude; this number, with the addition of the reſerved ſeconds (which may be made by memory), will give the ſemidiameter in altitude.

### EXAMPLE.

Let the apparent altitude of the Moon's lower limb be 25°. 43′. 13″, and the Moon's horizontal ſemidiameter 15′. 48″.

For 15′. 40″. horizontal ſemidiameter, and 26° altitude, the table gives 15′. 47″; to which the 8 reſerved ſeconds are to be added, in order to have the ſemidiameter in altitude 15′. 55″.

* For finding the numbers of this table, I have employed the corrections given by Dr. Maſkelyne, in the firſt volume of the Greenwich Obſervations.

## TABLE VIII.

*Correction of the Semidiameter of the Sun and Moon.*

By an effect of the difference between the refractions which take place at different altitudes, the apparent femidiameter of the Sun and Moon is leſs, in proportion as the ſame ſemidiameter is inclined to the diameter parallel to the horizon; which is not affected by this cauſe. This correction may, therefore, be ſubtracted from the ſemidiameter given by the ephemeris, when great accuracy is deſired in the uſe of the lunar obſervations, for the purpoſe of aſcertaining the longitude.

## TABLE IX.

*Correction (additive) of the Apparent Altitudes of the Moon.*

The Moon's horizontal parallax may be found by the Nautical Almanac. The parallax becomes leſs, as the altitude increaſes; but (except when at the zenith) it always makes the Moon appear lower than it is. This effect, however, is diminiſhed by the refraction, which operates in a contrary way on the apparent ſituations. The preſent table gives the ſum of theſe two corrections, which is to be added to the Moon's apparent altitude, in order to obtain the true altitude *.

The numbers will be found at ſight to any minute of altitude; and the proportional parts for ſeconds of parallax are given to every two degrees, ſo that they need only be added to the former, in order to have the correction required.

The parts of this, and the following table, which depend on the ſame arguments, are printed in oppoſite pages, ſo that both may be uſed at one opening of the book.

## TABLE X.

*Auxiliary Arguments for Table XI.*

The arrangement of this table, being ſimilar to the preceding, the uſe of it only varies from the other, in requiring an additional correction according to the altitude of the Sun or Star, which is given at the foot of every page.

## TABLE XI.

*Numbers II. for correcting Sums of Altitudes.*
*Numbers I. for Sums of Apparent Altitudes - } and Auxiliary Arguments.*
*and Number III. for Apparent Diſtances - - }*
*Sums for finding the corrected Diſtances.*

All the numbers of this table are given for each complete degree, and to every minute of lateral argument, in two oppoſite pages. Numbers II. depend on the corrected ſums of altitudes, and the parts for ſeconds are placed by the column of minutes, which, for that purpoſe, muſt be uſed as if it referred to ſeconds. Numbers I. and III. depend on a double argument; but parts for ſeconds are only wanted for the top, or auxiliary argument, and theſe are likewiſe exhibited at the ſide of the column of minutes. It is to be obſerved, that the parts for ſeconds are always additive, and muſt be taken even when the number is 0″.

* This table has been computed by Mr. I. Mortlock, a moſt ſkilful and ingenious navigator, to whoſe friendſhip I am indebted for able aſſiſtance on this and many occaſions.

The

The arrangement of the Sums for finding the Corrected Diſtances is ſimilar to that of Numbers II.

All the Numbers are compoſed of ſeven figures, but the three firſt are only marked in the beginning of each zone, or ſection, of five lines, and when they ſuffer an alteration. It, however, ſometimes happens in Numbers I, and III, that ſuch changes take place in an intermediate point of the ſame line. This will be known to be the caſe, when three figures in a parentheſis follow the three firſt figures; and then the reſpective four figures in that part of the line which precedes the place where the firſt of theſe figures changes from 9 to 0, or vice-verſa, are to be added to the firſt three figures; and the four figures in the line after that place are to be added to the three figures in the parentheſis.

EXAMPLES.

What is Number I. for Sum of Apparent Altitudes 07°. 50′, and Auxiliary Argument 10′. 34″?

| | |
|---|---|
| Number I. for S. A. A. 07°. 50′, and Aux. Arg. 10′ - | 1627917 |
| Parts for 34″ | 110 |
| Number I. required - - - - - - - - - - - | 1628027 |

What is Number III. for Apparent Diſtance 120°. 2′, and Auxiliary Argument 32′. 0″?

| | |
|---|---|
| Number III. for A. D. 119°. 2′ and Aux. Arg. 32′ - | 2619273 |
| Parts for 0″ | 342 |
| Number III. required - - - - - - - - - - - - | 2619615 |

What is Number II. for Corrected Sum of Altitudes 84°. 45′. 47″?

| | |
|---|---|
| Number II. for 84°. 43′ - - - - - - - - - - | 1109156 |
| Parts for 47″ | 03 |
| Number II. required - - - - - - - - - - - | 1109210 |

What is the Corrected Diſtance for the Sum 421701 ½?

Sum 4216849 anſwers to 38°. 27′
Diff. 7014 / 165 - - to 55″
} Corrected Diſtance required 38°. 27′. 55″

## TABLE XII.

*Correction of the Moon's Horizontal Parallax, on account of the ſpheroidal Figure of the Earth.*

For the calculations of this, and other tables, where the earth is conſidered as ſpheroidal, I have ſuppoſed, that the polar axis is to the diameter of the equator as 320 to 321.

## TABLE XIII.

*Corrections to be added to the Lunar Diſtances, on account of the ſpheroidal Figure of the Earth.*

## TABLE XIV.

*Logarithms to compute the Corrections to be ſubtracted from the Lunar Diſtances, on account of the ſpheroidal Figure of the Earth.*

I ſhall reſerve the explanation of the uſe of theſe tables for my Treatiſe on Navigation.

## TABLE XV.

*Proportional Logarithms.*

Theſe Proportional Logarithms, contrived by the preſent learned Aſtronomer Royal, are peculiarly uſeful for finding the apparent time, at Greenwich, by the obſerved diſtance from the moon to the ſun, or a ſtar. The top argument, containing the degrees, or hours, and minutes, is to be joined with the lateral argument, containing the ſeconds as they are wanted, either for time, or for degrees. Thus the Proportional Logarithm of $0^{\circ}.9'.27''$, or $9^{m}.27^{s}$, is 127984.

## TABLE XVI.

*Logarithms of Numbers.*

This table has two arguments, one for the natural numbers, as uſual; another for the degrees, or hours, minutes, and ſeconds; by means of which the logarithm of the number of ſeconds contained in any expreſſion, under $3^{\circ}.10'$, or $3^{h}.10^{m}$, may be readily found.

The figures, at the top of each column, are to be joined with the lateral argument, in order to compoſe the numbers wanted. The degrees, or hours, are marked at the top of each page. Thus it will appear, that 3.94086 is the logarithm of the number 8727, or of $2^{\circ}.25'.27''$, or $2^{h}.25^{m}.27^{s}$.

This table will facilitate the calculations of ſexageſimal expreſſions, by ſaving the trouble of reducing degrees, or hours, and minutes into ſeconds.

## TABLE XVII.

*Logarithmic Sines, Coſines, Secants, Coſecants, Verſed,* Coverſed, Sacverſed, and Sacoverſed.*

This table contains two arguments, one in parts of the circle, the other in time, and they extend as far as $180^{\circ}$, or $6^{h}$.

The arguments, ſine, coſine, &c. refer to the degree, and hour, which are marked in the ſame line, at the top, or bottom, of the ſide columns.

The lateral arguments, to the left, for minutes of the circle, and for the correſponding minutes and ſeconds of time, are to be uſed with the reſpective arguments at the top for degrees and hours; and the lateral arguments to the right, with the arguments at the bottom.

The minutes of time are marked only once in the beginning of each zone of five lines; that is, on the upper line of the argument to the left, and on the lower line of the argument to the right.

In a line with each minute of a degree, or four ſeconds of time, of lateral argument, anſwer the logarithmic ſines, coſines, &c. to every additional $15''$, or $1'$; but the firſt figures are only marked once, at the beginning of each zone a little ſeparated

* What I call here, for the ſake of brevity, Logarithmic Verſed, &c. are the logarithms of half the verſed-ſine, &c.

from

from the others; and the remaining figures in the other columns, according to the arguments, muſt be added to the former, in order to compoſe the logarithms required. If a change from 0 to 9, or vice-verſa, happens in the ſame line, an aſteriſk is placed as a mark of this circumſtance; and then the upper firſt figures are to be uſed before, and the lower firſt figures after, the variation. For example, in page 416, the Logarithmic ſine of 14°. 12′. 30″. is 9.38996, and the logarithmic ſine of 14°. 12′. 45″, is 9.39008.

When the change is in the top line of the page the preceding firſt figure, or figures, are placed in the ſame line before the aſteriſk; and when the change is in the bottom line, the following firſt figures are placed after the aſteriſk and within a parentheſis. For example, in page 398, the logarithmic ſine of 0°. 0′. 15″ is 5.[illegible], and the logarithmic ſine of 0°. 0′. 30″ is 6.16270; and, in page 401, the logarithmic verſed of 6°. 59′. 15″ is 7,56980, and the logarithmic verſed of 6°. 59′. 30″ is 7,57032.

At the ſight of the table it appears that each logarithm anſwers to four arguments in parts of the circle, and as many in time. Thus, in page 434, the number 9.96285 is the log. coſine of 23°. 21′. 45″, or 1ʰ. 33ᵐ. 27ˢ. the log. ſine of 113°. 21′. 45″, or 7ʰ. 33ᵐ. 27ˢ, the log. ſine of 60′. 38′. 15″, or 4ᵐ. 26ˢ. 33ᵗ, and the log. coſine of 156°. 38′. 15″, or 10ʰ. 26ᵐ. 33ˢ. On taking out the arch anſwering to a given log. ſine, coſine, &c. the expreſſion will be choſen which ſuits the object of the calculation.

## TABLE XVIII.

*To convert Signs into Degrees, or Hours.*

## TABLE XIX.

*To convert Seconds of the Circle into Seconds and Decimals of Time.*

## TABLE XX.

*To convert Decimals of a Second of Time into Seconds and Decimals of the Circle.*

Degrees, minutes, &c. may be converted into time, and vice-verſa, by means of the two arguments of Table XVII, which give, at ſight, the equivalent expreſſions to every 15″, or 1′. The preceding three tables are intended to facilitate the ſame operation, when the given numbers contain ſigns, or decimals of a ſecond, either of the circle, or time.

## TABLE XXI.

*Side for computing the Latitude by Two Altitudes.*

## TABLE XXII.

*Angle for computing the Latitude by Two Altitudes.*

The pages of theſe two tables are arranged in a ſimilar manner, but alternately, in order to facilitate the taking out of the ſide and angle required for the calculation of the latitude, at the ſame opening of the book.

The differences of the ſucceſſive numbers in the ſame column are diſtinguiſhed by letters, and the correſponding proportional parts for ſeconds of interval are placed contiguous to the ſide argument for minutes, which for that purpoſe muſt be uſed as if it referred to ſeconds. The differences between the numbers in the ſame line are given in

the reſpective columns under D; and their proportional parts for ſeconds of top argument from 1 to 9, and from 10 to 50 will be found, at ſight, on each page; with which the proportional parts for any number of ſeconds may be eaſily compoſed. The proportional parts of both arguments are always additive; and on making the addition it will be ſufficient to take the neareſt minute.

EXAMPLE.

What is the ſide for interval $1^h.47^m.38^s$, and complement of declination $71°.46'$?

| | | |
|---|---|---|
| Side for interval $1^h.47^m$, and compl. of declination $71°$ - - | | $25°.16$ |
| Prop. part of $e$ for $38^s$ - - - | + | 8,9 |
| Prop. parts of $9'$ for $40'$ - - - | + | 6,0 |
| Prop. parts of $9'$ for $6$ - - - | + | 0,9 |
| Side required - - - - - | | $25.32$ |

## TABLE XXIII.

*Difference between the Sun's Meridional Altitude, and its Altitude one Minute before, or after Noon.*

This table is not to be uſed in the places marked with a *.
In taking out the numbers a double proportional part may be uſed, as follows:

EXAMPLE.

What is the number of the table for $14°.46'$ of north latitude, and $4°.37'.15''$ of north declination?

| | | |
|---|---|---|
| For $14°$ latitude and $4°$ declination of the ſame name - - - | | 11″,0 |
| Diff. for $1°$ latitude — 1″,1 ($60' : 1'',1 :: 46' : x$) Prop. part | — 0″,8 | — 0 ,1 |
| Diff. for $1°$ declin. + 1 ,2 ($60 : 1 ,2 :: 37 : x$) Prop. part | + 0 ,7 | |
| Number of the table required - - - - - - | | 10 ,9 |

## TABLE XXIV.

*Multipliers for the Uſe of the foregoing Table.*

This table requires no explanation. For $7^m.28^s$ of interval the multiplier is 55,8.

## TABLE XXV.

*Catalogue of the principal Stars.*

The right aſcenſions and declinations of the principal ſtars, to the number of 60 (the ſame as are given in the Requiſite Tables), are laid down for the beginning of the year 1800, and muſt be reduced to the time required, by means of the annual variations. The ſigns + or — attached to each variation, ſignify that it muſt be added or ſubtracted for the ſubſequent years; but if the ſituations of the ſtars are wanted for any time before 1800, the ſigns of the variations muſt be changed, making the poſitive negative, and vice-verſa.

EXAMPLE.

EXAMPLE.

What is the right aſcenſion in time, and the declination of the Lion's heart, or Regulus, the 3d of September 1805?

From the beginning of 1800 to September 3, 1805, there are 5 years and 9 months, that is $5\frac{9}{12}$ years.

| | |
|---|---|
| Right aſcenſion for 1800 - - - - - - - | $9^h.57^m.42^s,38$ |
| Annual variation $+ 3^s,212 \times 5\frac{9}{12} = 18^s,469$ - - - + | 18,47 |
| Right aſcenſion required - - - - - - - | 9.58.0,85 |
| Declination for the beginning of 1800 - - - - - | 12°.56′.25″ N. |
| Annual variation $- 17'',19 \times 5\frac{9}{12} = 98'',84$ - - - — | 1.39 |
| Declination required - - - - - - - - | 12.54.46 |

## TABLE XXVI.

*Acceleration of the Fixed Stars in Mean Time.*

By means of this table ſideral time may be converted into mean time, and vice-verſa. With the acceleration for days the going of a Chronometer may be alſo aſcertained, by the obſerved paſſages of a fixed ſtar over the meridian, according to a very ſimple method, which ſhall be explained in my Treatiſe on Navigation.

## TABLE XXVII.

*To convert Mean Time into Parts of the Equator.*

This table may be uſeful to convert into degrees, &c. of the circle, the hours, minutes, &c. of a clock, or chronometer, which is regulated according to mean time.

## TABLE XXVIII.

*To find the Circumſtances which are favourable for obſerving the Altitude of the Sun, in order to determine the apparent Time.*

The obſervation moſt favourable for determining the apparent time is that of the altitude of the Sun, when it is in the prime vertical, or neareſt the prime vertical. The firſt caſe happens, when the latitude of the place is of the ſame name and greater than the declination; the ſecond in all the other circumſtances. The preſent table gives the time from noon, and the altitude which then takes place, by which the obſerver may be guided in the choice of his obſervations. Suppoſing, for example, that the ſhip is in 27° north latitude, and that the Sun's declination is 12° north, it will be found that the altitude muſt be taken $4^h.21^m$ from noon, that is, at $4^h.21^m$ P.M., or $7^h.39^m$ A.M.; or when the Sun's altitude is 27°.15′.

The table relates only to the ſituations, where the latitude of the ſhip is of the ſame name as the Sun's declination. In the other caſes the Sun is neareſt the prime vertical when at the horizon; but, as the uncertainty and irregularity of the refraction are then very conſiderable, it is recommended not to obſerve the altitude while the Sun is leſs than 3° or 4° above the horizon.

## TABLE XXIX.

*Time anſwering to a change of One hundred Minutes of Altitude near the Horizon.*

This table is ſubſidiary to the following, and contains the expreſſions reduced into ſeconds, in order to facilitate the multiplications.

The firſt page of the table is general in all caſes; but, among the others, one is to be uſed when the declination of the Sun and the latitude of the place are of the ſame name, the other when they are of different names*.

## TABLE XXX.

*Semidiurnal Arches.*

Theſe arches ſhew the time which the Sun employs in paſſing from the horizon to the meridian, or from the meridian to the horizon. Therefore, the ſemidiurnal arch is the hour of the day at the moment of the Sun's ſetting; and the complement of the ſame arch to 24 hours, is the aſtronomical time (or the complement to 12 hours, the civil time) of the day at the moment of the Sun's riſing.

EXAMPLE.

What are the times of the Sun's riſing and ſetting in 20°. 16′ north latitude, when the Sun's declination is 16°. 9′ north?

| | | |
|---|---|---|
| Semidiurnal arch for 20° latit. and 16° declin. of the ſame name | | $6^h.\ 23^m.\ 56$ |
| Diff. for 1° latitude | $+\ 1^m.\ 20^s$ (60′ : 80ˢ :: 16′ : $x$) Prop. part + | 21 |
| Diff. for 1° declination | $+\ 1\ .\ 36$ (60 : 96 :: 9 : $x$) Prop. part + | 14 |
| Semidiurnal arch required, or time of ⊙'s ſetting | | 6 . 24 . 31 |
| | | 24 |
| Time of ⊙'s riſing | | 17 . 35 . 29 |

Thus, the times of Sun's riſing and ſetting may be found for any given day and latitude, aſcertaining firſt the Sun's declination by the Nautical Almanac.

At Sea, the height of the obſerver's eye, and the horizontal refraction and parallax of the Sun, alter the apparent time of the riſing and ſetting; and this difference may be found by means of Table XXIX. The dip of the horizon, and the horizontal refraction diminiſhed by the parallax of the Sun, (32′. 51″), are to be added together; and the ſum, multiplied by the number of the ſaid table, will (after ſtriking off the two laſt figures) give the correction which is to be added to the ſemidiurnal arch found before, in order to have the apparent times required.

* The latitude and declination are conſidered as either *north* or *ſouth*, and therefore may be diſtinguiſhed by theſe *names*. Thus we ſhall ſay, that the ſhip's latitude and the ſun's declination are of the ſame name, when they are both north or both ſouth; and that they are of different names, when one is north and the other ſouth. The ſame expreſſions will be applied to the other quantities which may be diſtinguiſhed into north or ſouth, and eaſt or weſt.

EXAMPLE.

Suppoſe, in the foregoing example, that the height of the eye is 18 feet.

| | | | |
|---|---|---|---|
| Number of Table XXIX. for 20° latitude and 16° declination | | | 447 |
| Diff. for 2° latitude | + 5″ | (120′ : 5″ :: 16′ : $x$) Pr. p. | + 1 |
| Diff. for 1° declination | + 3 | ( 60 : 3 :: 0 : $x$) Pr. p. | + 0 |
| Number required | | | 448 |
| Dip | 4′. 11 | | |
| Hor. refract.—parallax | 32. 51 | | |
| Sum | 37. 2 | 37′ × 448″ | + 0h. 2m. 46″ |
| Semidiurnal arch found before | | | 6. 24. 31 |
| Sem. arch corrected, or time of ⊙'s apparent ſetting | | | 6. 27. 17 |
| | | | 24 |
| Time of ⊙'s apparent riſing | | | 17. 32. 43 |

The times, thus computed, relate to the Sun's center; but the apparent riſing and ſetting of either of the limbs might be found in the ſame manner, by adding the Sun's ſemidiameter (as given by the Ephemeris), together with the dip and the number 32′. 51″ for the upper limb; or ſubtracting the ſemidiameter from the ſum of theſe two quantities for the lower limb. Thus, ſuppoſing the ſemidiameter to be 15′. 53″, the calculation of the example for the lower limb will ſtand thus:

| | | | |
|---|---|---|---|
| Dip | 4′. 11″ | | |
| Hor. refrac. — parallax | 32. 51 | | |
| Sum | 37. 2 | | |
| Semidiameter | 15. 53 | | |
| Remainder | 21. 9 | 21′,1 × 448″ | + 0h. 1m. 35″ |
| Semidiurnal arch found before | | | 6. 24. 31 |
| Time of lower limb's apparent ſetting | | | 6. 26. 6 |
| | | | 24 |
| Time of lower limb's apparent riſing | | | 17. 33. 54 |

## TABLE XXXI.

*Amplitudes of the Sun.*

The uſe of this table is obvious, the differences being given for a change of 100′ in each of the arguments.

The Sun's amplitude is from the eaſt, if at riſing, or, from the weſt, if at ſetting; and to the north, or ſouth, according to the name of the Sun's declination.

EXAMPLE.

What is the amplitude of the Sun at riſing in 21°. 43′ north latitude, when the Sun's declination is 6°. 17′ north?

| | | |
|---|---|---|
| Amplitude for 21° latitude and 6°. 30′ declination | - - | 6°. 57′ |
| Diff. for 100′ latitude | + 5′ × 43′ = 215′ - - - | + 2 |
| Diff. for 100 declination | + 110 × 17 = 1870 - - - | + 19 |
| Amplitude required | - - - - - - - | 7. 18 E.N. |

The Sun's declination may be found, by the Nautical Almanac, for the time of its riſing or ſetting at any given place (ſee Problem I); with which, and the latitude, the amplitude will be thus eaſily computed. This is, however, the amplitude which takes place when the Sun is in the true, and not in the viſible horizon. In order to uſe it, in deducing the variation of the Compaſs, the amplitude of the Sun's center muſt be taken with the Compaſs when the lower limb appears elevated above the horizon, by a ſpace ſomewhat exceeding that of the ſemidiameter. The compariſon between the obſerved amplitude, and the amplitude found by the table, will then give the variation of the Compaſs, with ſufficient accuracy for the general purpoſes of Navigation.

| | | |
|---|---|---|
| Suppoſe, for example, that, for the place and time of the preceding computation, the amplitude obſerved with the Compaſs in the manner already mentioned is | - - - - - | 19°. 56′ E.N. |
| True computed amplitude | - - - - | 7. 18 E.N. |
| Variation of the Compaſs | - - - - | 12. 38 E. |

## TABLE XXXII.

*Variations of the Amplitudes, anſwering to a Change of One hundred Minutes in the Sun's Altitude.*

This table is ſubſidiary to the preceding, and may ſerve to find the corrections which are to be applied to the true amplitude of the Sun's center, in order to obtain the amplitude which takes place at the time of the Sun's upper, or lower limb, touching the viſible horizon. The dip of the horizon and 32′. 51″ are to be added together, and likewiſe the Sun's ſemidiameter, for the upper limb; but, for the lower limb, the ſemidiameter is to be ſubtracted from the ſum of the two firſt quantities: the ſum, or remainder, is to be multiplied by the number of this table; and the product (cutting off the two laſt figures) will be the correction to be added to, or ſubtracted from, the true amplitude, according as the latitude and declination are of the ſame name, or of different names, in order to obtain the amplitude required.

EXAMPLE.

EXAMPLE.

What is the Sun's apparent amplitude at the ſetting of the lower limb in 46°. 38′ north latitude, when the Sun's declination is 21° 27′. 4″ ſouth, the Sun's ſemidiameter 16′. 15″, and the height of the obſerver's eye 21 feet?

Table XXXI gives,

| | | | |
|---|---|---|---|
| Amplitude for 46° latitude and 21°. 15′ declination | - - | | 31°. 27′ |
| Diff. for 100′ latitude - + 65′ × 38′ = 2470′ | - - | + | 25 |
| Diff. for 100 declination + 160 × 27 = 4320 | - - - | + | 43 |
| True amplitude of the ☉'s center towards the depreſſed pole | - | | 32. 35 W.S. |
| For that amplitude and 46° lat. Table XXXII. gives 126 | | | |
| Dip - - - | 4′. 31″ | | |
| Hor. refract. — parallax | 32. 51 | | |
| Sum - - - - | 37. 22 | | |
| Semidiameter - - | 16. 15 | | |
| Remainder - - | 21. 7 - | 21′,1 × 126 - | — 0°. 27′ |
| Apparent amplitude required | - - - - - - | | 32. 8 W.S. |
| The Sun's amplitude, having been obſerved, with the Compaſs, when the lower limb appeared to touch the horizon, was found to be - | | | 21. 39 W.S. |
| The variation of the Compaſs, therefore, is | - - - - | | 10. 29 W. |

## TABLE XXXIII.

*Equations of equal Altitudes, for Noon.*

The motion of a watch, or pendulum clock, may be aſcertained by obſerving the ſun, when at the ſame altitude, in the morning, and in the afternoon. For that purpoſe, the middle of the times of the two obſervations, by the watch or clock, muſt be taken, and a correction is to be applied to it, in order to deduce the time marked by the ſaid watch, or clock, at the moment of true noon. This equation will be eaſily found by means of the preſent table.

The equation is divided in two parts, and both have for arguments the Sun's longitude (which muſt be previouſly found by the Nautical Almanack), and the interval, or time elapſed, between the obſervations: the firſt part is, beſides, to be multiplied by the tangent of the latitude, or, which comes to the ſame, by the ſine and ſecant, of the place of obſervation. The ſigns at the top of each ſection mark, whether ſuch a part muſt be added to, or ſubtracted from, the middle-time, in order to have the time of true Noon; but the ſigns of the firſt part muſt be changed, if the place of obſervation is in the ſouthern hemiſphere. An example will illuſtrate theſe rules.

EXAMPLE.

EXAMPLE.

September 17, 1789, (civil time) the following obſervations were made by Count de Bruhl, at his Obſervatory at Harefield, ſituated in latitude 51°. 36′. 9″.

| Altitude of ⊙'s upper limb | Times by the Chronometer, morning | Times by the Chronometer, afternoon |
|---|---|---|
| 67°. 40′ | 21h. 42m. 21s,4 | 2h. 0m. 3s,0 |
| 68. 0 | 21. 44. 5,0 | 1. 58. 22,0 |
| 68. 20 | 21. 45. 45,5 | 1. 56. 39,0 |
| 68. 40 | 21. 47. 29,0 | 1. 54. 55,4 |
| 69. 0 | 21. 49. 12,4 | 1. 53. 11,0 |
| 69. 20 | 21. 52. 46,4 | 1. 49. 41,0 |
| 69. 40 | 21. 54. 31,6 | 1. 47. 52,0 |
| 70. 0 | 21. 56. 15,6 | 1. 44. 11,2 |
| Sums - - - | 174. 34. 26,9 | 15. 4. 54,6 |
| Means (dividing by 8) - | 21. 49. 18,4 | 1. 53. 6,8 |
| | 25. 53. 6,8 | Interval (difference) 4h. 3m. 48s,4 |
| | | or, 4. 4 |
| Sum - - - - | 47. 42. 25,2 | |
| Middle time (half) - | 23. 51. 12,6 | |

The Sun's longitude was then 5 ſigns 25°. Conſequently,

| | | First part. | Second part. |
|---|---|---|---|
| For 5 ſigns 25°, and | 4h. 0m | +15′,53 | —0,46 |
| | 4. 20 | +15,66 | —0,45 |
| Differences - - | | 0,13 | 0,01 |

20m : 0′,13 :: 4m : x (= 4′ × 0,13 / 20 = 0,03)  20m : 0′,01 :: 4m : x (= 4′ × 0,01 / 20 = 0,00)

| | | | |
|---|---|---|---|
| For 6 ſigns 0°, and | 4h. 0m | + 15,63 | 0′,00 |
| | 4. 20 | + 15,76 | 0,00 |
| Difference - - | | 0,13 | |

20m : 0,13 :: 4m : x (= 4 × 0,13 / 20 = 0,03)

Therefore,

| | | | |
|---|---|---|---|
| For 5s. 25° and 4h. 4m | | +15′,56 | —0′,46 |
| 6. 0 | | +15,66 | 0,00 |
| Differences - - | | 0,10 | 0,46 |

5° : 0′,10 :: 1° : x (=0,02)  5° : 0′,46 :: 1° : x (=0,09)

| | First part. | Second part. |
|---|---|---|
| Thus for 5 ſigns 26°, and 4h. 4m - | + 15′,58 | — 0′,37 |
| Log. firſt part - - - | 1.19257 | |
| Log. ſine latitude - - - | 9.89417 | |
| Log. [illegible] - - | 0.20084 | |
| Log. firſt part corrected (ſum) - | 1.29358 | + 19,66 |
| Equation [illegible] - - - - - | | + 19,29 |
| Middle-time - - - - - - | | 23h. 51m. 12,60 |
| Time of true Noon - - - - - | | 23. 51. 31,89 |

To the time of true Noon by the Chronometer, thus obtained, it is only neceſſary to apply the equation of time, in order to compare the Chronometer with equated, or mean time. The equation of time in the preſent example is — $5^m$. 49″,5, ſo that at true Noon the mean time is $23^h$. $54^m$. 10″,5; and from hence it reſults, that the Chronometer deviated — $2^m$. 38″,61 from mean time.

By the repetition of the like operation, the abſolute ſtate and daily motion of a Chronometer may be aſcertained; but for a more minute inveſtigation of this ſubject, I muſt refer to my Treatiſe on Navigation.

## TABLE XXXIV.

*Lengths in Minutes of the Equator, of one Degree of the different Parallels of Latitude, both for the Sphere and Spheroid.*

## TABLE XXXV.

*Lengths in Minutes of the Equator, of the different Arches of the Meridian, in the Spheroid, from the Equator to the Pole; and alſo of the reſpective Degrees of Latitude.*

Theſe two tables do not require, at preſent, any explanation.

## TABLE XXXVI.

*Diſtances from the viſible Horizon of the Sea to the Obſerver, according to the Elevation of the Eye above the Sea, and to other Objects, according to the Heights depreſſed under the ſame Level.*

This table may be uſeful to find the diſtances from a ſhip at ſea to any other object, when the height depreſſed under the horizon is known. Suppoſe, for example, that an obſerver on the deck of a ſhip, having his eye elevated 17 feet above the ſea, is in ſight of a light-houſe on ſhore, and that from the part of it diſcovered he eſtimates that the remaining height hidden under the horizon is 70 feet; the diſtance from the ſhip to the light-houſe will be concluded as follows,

| | | |
|---|---|---|
| Diſtance for 17 feet | | 4,735 |
| Diſtance for 70 feet | | 9,609 |
| Diſtance required | (Sum) | 14,344 |

If the object is at the edge of the viſible horizon, the diſtance for the elevation of the eye will be the diſtance required.

## TABLE XXXVII.

*Corrections to be applied to the time of High Water, at full and change of the Moon, to find the time of High Water on any other Day.*

With the help of this table, the time of high water may be found for any day in a known harbour, or any other place on the ſea coaſt. For this purpoſe the time of the neareſt phaſe of the moon at Greenwich (as given by the Nautical Almanac) muſt be reduced to the meridian of the given place, by adding or ſubtracting the longitude, according as it is eaſt or weſt. The interval between that reduced time and the given

day will give the correction which is to be applied * to the time of high water at full and change of the moon, in order to have the approximated time of high water on the given day. And applying again the corresponding correction to the interval between the reduced time of the phase, and that approximated time, the result will be the time of the first high water, on that astronomical day.

For the time of the second high water, the last interval must be diminished or increased by 12 hours, according as the given day falls before or after the phase; and the corresponding correction applied as before will give the time of the second high water.

EXAMPLE.

What are the times of the first and second high water at Port Praya in the island of St. Jago, August 11, 1792?

| | | |
|---|---|---|
| Time of ☾'s last quarter at Greenwich, August | $9^{d}.\ 2^{h}.\ 55^{m}$ | |
| Longitude of Port Praya W. — | 1 . 34 | |
| Time of ☾'s last quarter at Port Praya | 9 . 1 . 21 | |
| Given day | 11 . | |
| Interval after last quarter | 1 . 22 . 39 | |
| Correction for that interval + | 7 . 32 | |
| Time of high water at Port Praya at full and change | 11 . 0 | A.M. |
| Sum | 11 . 18 . 32 | |
| Approximated time of high water, August | 11 . 6 . 32 | |
| Time of ☾'s last quarter | 9 . 1 . 21 | |
| Interval after last quarter | 2 . 5 . 11 | |
| Correction for that interval + | 7 . 53 | |
| Time of high water at full and change | 11 . 0 | A.M. |
| Sum | 18 . 53 | |
| Time of first high water required | 6 . 53 | |
| Interval after last quarter + $12^{h}$ | 2 . 17 . 11 | |
| Correction for that interval increased + | 8 . 29 | |
| Time of high water at full and change | 11 . 0 | |
| Time of second high water required | 19 . 29 | |

## TABLE XXXVIII.

*The Latitudes and Longitudes of Places.*

This table is reprinted from the last edition of the Requisite Tables, by the obliging permission of the Commissioners of Longitude. It contains the latitudes of places with their longitudes, both in degrees and time, from the Meridian of the Royal Observatory at Greenwich: Also the times of High Water at the full and change of the Moon, at those places where it is known.

* In the columns before new moon and full moon, the corrections of the table are subtractive; in all the other columns they are additive.

## TABLE XXXIX.

*Differences of Latitude, and Departures for Quarter Points.*

## TABLE XL.

*Differences of Latitude, and Departures for Degrees.*

It does not belong to my preſent plan to enter into a particular explanation of theſe tables, the nature of which is well known. I have carried the diſtances to 480 miles.

## TABLE XLI.

*Meridional Parts.*

The meridional parts are here given to every minute of the quadrant; and I have added two decimals to the uſual numbers, for ſuch applications as require great accuracy.

## TABLE XLII.

*Reduced Latitudes, to be uſed for the Argument of the preceding Table, when the Meridional Parts are wanted in the Spheroid.*

The Meridional Parts of the preceding Table are computed on the ſuppoſition that the earth is a ſphere. If it is deſired to have the meridional parts for the ſpheroid, the preſent table gives the reduced latitudes, which then muſt be uſed as the true latitude in order to take out the number required *, out of Table XLI.

For example, if the meridional parts are wanted for latitude 28°. 43′ in the ſpheroid, the reduced latitude by Table XLII. is 28°. 33′. 58″; with which the meridional parts required will be found in Table XLI. to be 1789,73.

## TABLE XLIII.

*Proportional Parts of the Variations which take place in Periods of 12ʰ, and 6ʰ, for Longitude, or any other interval of Time.*

The elements of the Sun's and Moon's motions, contained in the Nautical Almanac, are given for noon, or for noon and midnight, of each day at Greenwich; that is, to every 24ʰ, or 12ʰ. In order to find the ſaid elements for any intermediate time, proportional parts of the variations muſt be applied, which may be readily found, by the preſent table, according to the variations and the intervals.

The top arguments, containing the intervals, and the equivalent expreſſions in degrees and minutes of longitude, are to be uſed for the variations which take place in 24ʰ; that is, for thoſe elements, which are given in the Ephemeris only for noon, ſuch as the right aſcenſion and declination of the Sun, &c. The intervals, contained in the bottom argument, are to be uſed for the variations which take place in 12ʰ, ſuch as the moon's right aſcenſion, declination, horizontal parallax, &c.

* This table has been computed according to the ratio of 320 to 321, upon the principle demonſtrated by the ingenious Mr. Delambre, in the *Connaiſſance des Tems* for the Year XIII.

The

The variation, or lateral argument, has three ſexageſimal ſigns, ſo that it may be taken for degrees, minutes, or ſeconds; and the head of each column contains three rows of correſponding ſigns, of which the higher, the middle, or the lower is to be uſed with the ſign of the variation ſtanding in the like relative ſituation. Thus (in page 660), for $1^h$ interval of $24^h$, the table gives $1^\circ. 2'. 30''$, if the variation is $25^\circ$; or $1'. 2''. 30'''$, if the variation is $25'$; or $1''. 2'''. 30^{iv}$, if the variation is $25''$. And (in page 668) for $47^m$ interval of $24^h$, the proportional part is $1^\circ. 8'. 32''. 30'''$, or $1'. 8''. 32'''. 30^{iv}$, or $1''. 8'''. 32^{iv}. 30^v$, according as the variation is $35^\circ$, or $35'$, or $35''$. But the fourths, &c. may be always neglected, adding one to the thirds, if they are more than $30^{iv}$, and thus theſe numbers will be $1^\circ. 8'. 32''. 30'''$; $1'. 8''. 32'''$; $1''. 9'''$.

The proportional part, for any given variation, may be eaſily compoſed by taking the numbers of the table for the degrees, the minutes, and the ſeconds, and adding them together. Suppoſing, for example, that the proportional part is required for $49^m$ interval, and the variation $46^\circ. 39'. 45''$ in $24^h$, it will be found, in the ſame column, as follows:

| | Variation. | | |
|---|---|---|---|
| For $49^m$ interval, and | $46^\circ$ | - - - | $1^\circ. 33'. 55''. 0'''$ |
| | $39'$ | - - - | $1. 19. 37$ |
| | $45''$ | - - - | $1. 32$ |
| Proportional part required | | - - - - | $1. 35. 16. 9$ |

The thirds may be always omitted in the ſum, adding one to the ſeconds, if there are more than $30'''$; which circumſtance will be eaſily attended to, at the time of caſting the figures, without writing the thirds. Thus the above proportional part will be $1^\circ. 35'. 16''$.

The lateral argument, of the firſt two pages of the table, contains the intervals to every hour for the variations in $24^h$, and to every half hour for the variations in $12^h$; the intervals of the other pages are minutes for $24^h$, and half minutes for $12^h$. The given interval may be thus compoſed of theſe two arguments, taking out the numbers which are to be added together, in order to have the proportional part required. For example, if the interval of $24^h$ is $17^h. 49^m$, and the variation $49^\circ$, we ſhall have:

| | Variation. | | |
|---|---|---|---|
| For interval $17^h$ / $49^m$ | and $49^\circ$ | - - | $34^\circ. 42'. 30''. 0'''$ |
| | | - - | $1. 40. 2. 30$ |
| Proportional part required | | - - - | $36. 22. 32$ |

From the above explanation, or, from the mere ſtructure of the table, it appears how the proportional part may be found for any given interval and variation. The following examples will make the proceſs ſtill more clear; but we ſhall farther obſerve, that, though, to prevent the table from being crouded, the ſexageſimal ſigns laid down relate only to the diviſions of the circle, the table may be likewiſe uſed for variations expreſſed in time, by ſimply changing the degrees into hours, and taking the minutes of a degree as minutes of time, &c.

EXAMPLE I.

What is the proportional part of the variation $3^\circ. 29'. 54''$ in $24^h$ for the interval $23^h. 4^m$?

For

| | | Variation. |
|---|---|---|
| For $21^h$ interval, and | $3^\circ$ | $2^\circ. 37'. 30''. 0'''$ |
| | $29'$ | $25 . 22 . 30$ |
| | $54''$ | $47 . 15$ |
| For $43^m$ interval, and | $3^\circ$ | $5 . 22 . 30$ |
| | $29'$ | $51 . 57$ |
| | $54''$ | $1 . 37$ |
| Proportional part required | | $3 . 9 . 56$ |

EXAMPLE 2.

What is the proportional part of the variation $4^h. 56^m. 18^s$ in $24^h$, for the interval $13^h. 27^m$?

| | | Variation. |
|---|---|---|
| For $13^h$ interval, and | $4^h$ | $2^h. 10^m. 0^s. 0^t$ |
| | $56^m$ | $30 . 20 . 0$ |
| | $18^s$ | $9 . 45$ |
| For $27^m$ interval, and | $4^h$ | $4 . 30 . 0$ |
| | $56^m$ | $1 . 3 . 0$ |
| | $18^s$ | $20$ |
| Proportional part | | $2 . 46 . 3 . 5$ |
| Or * | | $2 . 46 . 3,1$ |

EXAMPLE 3.

What is the proportional part of the variation $7^\circ. 32'. 24''$ in $12^h$, for the interval $9^h. 51^m$?

| | | Variation. |
|---|---|---|
| For $9^h. 30^m$ interval, and | $7^\circ$ | $5^\circ. 32'. 30''. 0'''$ |
| | $32'$ | $25 . 20 . 0$ |
| | $24''$ | $19 . 0$ |
| For $21^m$ interval, and | $7^\circ$ | $12 . 15 . 0$ |
| | $32'$ | $56 . 0$ |
| | $24''$ | $42$ |
| Proportional part required | | $6 . 11 . 21$ |

The proportional parts of the variations in $24^h$, for the ſeconds of interval, might be found by ſimply looking for the interval, as minutes, and reducing the ſexageſimal ſigns at the heads of the columns to the immediate lower denomination; but this will be ſeldom wanted. Even the ſeconds of the variations may commonly be neglected, taking the proportional parts only for the degrees, or hours, and minutes.

* Sexageſimals are eaſily reduced into decimals, dividing by 6: thus $5^t$ makes $0^s,1$, or $0^s,08$, &c. according as tenths, or hundreds, &c. are wanted; and decimals are reduced into ſexageſimals by the inverſe operation, that is, multiplying by 6, and ſtriking off one figure if they are hundreds, two figures if they are thouſands, &c.

## TABLE XLIV.

*Equations of Second Differences for* 12 *Hours.*

The variations of the Moon's right aſcenſion, declination, &c. not being uniform, when proportional parts are uſed, it is, beſides, neceſſary to apply an equation, on account of the ſecond differences; that is, the differences of the firſt differences. This equation is to be applied with the ſame, or a contrary ſign to that of the proportional part, according as the variations decreaſe, or increaſe.

The number for the minutes and ſeconds, not in the argument, will be found by addition. Thus, for $9^h.\ 10^m$ after noon, and $16'$ ſecond difference, the correction is $54',1 + 32'',5 = 1'.\ 26'',6$.

# PROBLEMS AND EXAMPLES.

## PROBLEM I.

*The Longitude of a Ship at Sea being given, to find the right Aſcenſion, Declination, &c. of the Sun or Moon for any time, under that Meridian, by means of the Nautical Almanac.*

1. CONVERT the ſhip's longitude into time, and, according as it is weſt, or eaſt, add it to, or ſubtract it from, the given time, in order to have the correſponding time at Greenwich.

Obſerve that, if the ſum in the preceding addition is greater than $24^h$, the exceſs above $24^h$ will be the correſponding time at Greenwich on the following day. When the longitude, though greater, is to be ſubtracted from the given time, this muſt be previouſly increaſed by $24^h$; and the remainder will then expreſs the correſponding time on the preceding day at Greenwich.

2. Take out of the Nautical Almanac the right aſcenſion, or declination, &c. for the noon immediately preceding, and the variation for $24^h$, or $12^h$ following; that is, the difference between the quantity taken, and that of the following noon or midnight.

3. With that variation, and the time at Greenwich (which, for the elements of the Moon is to be diminiſhed by $12^h$, when the time exceeds it) as interval, find the proportional part by Table XLIII. This, being added to, or ſubtracted from, the preceding right aſcenſion, declination, &c. will give the one required.

4. When the Sun's declination (or right aſcenſion, &c.) is wanted for noon at the ſhip, the trouble of finding the correſponding time at Greenwich is unneceſſary; and the proportional part of the variation may, at once, be found uſing the top argument in degrees and minutes of the circle. For this purpoſe, it will be ſufficient to take out the declination for noon of the ſame day, and the variation in the preceding 24 hours, if the longitude is eaſt, or in the following 24 hours, if the longitude is weſt, marking the ſign of the variation. The proportional part may then be found, entering the lateral argument with the longitude; and it muſt be applied to the declination taken out, in the manner indicated by the ſign of the variation.

### REMARK.

The Sun's ſemidiameter is given in the Nautical Almanac to every ſix days; from which the ſemidiameter may be taken at ſight for any intermediate day. For example, it will be ſeen that on March 11, 1792, the ſemidiameter is $16'.8$.

EXAMPLE 1.

What is the Sun's declination, February 3, 1792, at noon, in longitude 113°. 34′ weſt?

| | |
|---|---|
| Declination, Feb. 3 at noon at Greenwich - - - - - | 16°. 30′. 29″ S. |
| Vari. in the following 24ʰ, — 17′. 50″. Prop. part to 113°. 30′ long. — | 5 . 37 |
| Declination required - - - - - - - - - | 16 . 24 . 52 S. |

EXAMPLE 2.

What is the Sun's right aſcenſion June 16, 1792, at 4ʰ. 27ᵐ. 50ˢ, in longitude 93°. 18 eaſt?

| | |
|---|---|
| Time at the ſhip, June 16 - - - - - - - - - | 4ʰ. 27ᵐ. 50ˢ |
| Longitude E. 93° 18′ = - - - - - - - - — | 6 . 13 . 12 |
| Time at Greenwich the 15th - - - - - - - - | 22 . 14 . 38 |
| ☉'s right aſcenſion, June 15 at noon at Greenwich - - - | 5 . 37 . 55,9 |
| Var. in 24ʰ, + 4ᵐ. 9ˢ,4, or 4ᵐ. 9ˢ. Prop. part to 22ʰ. 15ᵐ, 3ᵐ. 50ˢ. 51ᵗ = + | 3 . 50,8 |
| Right aſcenſion required - - - - - - - - | 5 . 41 . 46,7 |

EXAMPLE 3.

What is the Moon's horizontal parallax, January 1, 1792, at 11ʰ. 35ᵐ. 41ˢ, in longitude 71°. 23′ weſt?

| | |
|---|---|
| Time at the ſhip January 1 - - - - - - - - | 11ʰ. 35ᵐ. 41ˢ |
| Longitude W. 71°. 23′ = - - - - - - - - + | 4 . 45 . 32 |
| Time at Greenwich - - - - - - - - - | 16 . 21 . 13 |
| ☾'s horizontal parallax at midnight at Greenwich - - - | 55′. 32″ |
| Variation in 12ʰ, — 18″. Prop. part to 4ʰ. 21ᵐ - - - — | 7 |
| Horizontal parallax required - - - - - - | 55 . 25 |

EXAMPLE 4.

What is the Moon's declination, February 18, 1792, at 22ʰ. 28ᵐ. 13ˢ, in longitude 18°. 16′ eaſt?

| | |
|---|---|
| Time at the ſhip, February 18 - - - - - - - - | 22ʰ. 28ᵐ. 13ˢ |
| Longitude E. 18°. 16′ = - - - - - - - - — | 1 . 13 . 4 |
| Time at Greenwich - - - - - - - - - | 21 . 15 . 9 |
| ☾'s declination, Feb. 18 at midnight at Greenwich - - | 17°. 22′ S. |
| Variation in 12ʰ, — 53′. Prop. part to 9ʰ. 15ᵐ - - - — | 41 |
| Declination required - - - - - - - - - | 16 . 41 S. |

REMARK.

REMARK.

In finding the Moon's right aſcenſion and declination, regard may be had to the ſecond differences, taking the two quantities preceding, and the two following, in the Nautical Almanac. Thus, in the preceding example, we have:

| | ☾'s Declination. | First Diff. | Second Diff. | Mean Second Diff. |
|---|---|---|---|---|
| Feb. 18, at noon - - - | 17°. 57′ S. | | | |
| | - - — | 35′ | | |
| at midnight - - | 17 . 22 | | - - 18 | |
| | - - — | 53 | - - | 16′. 30″ |
| 19, at noon - - - | 16 . 29 | | - - 15 | |
| | - - — | 1°. 8 | | |
| at midnight - - | 15 . 21 | | | |

| | | |
|---|---|---|
| Declination Feb. 18 at midnight - - - - - | 17°. 22′ | S. |
| Variation in 12ʰ, — 53′. Prop. part to 9ʰ. 15ᵐ, — 40′. 51″ } | — 39 . 24″ | |
| Correction for 16′. 30″, 2ᵈ difference and 9 . 15 , + 1 . 27 } | | |
| Declination required - - - - - | 16 . 42 . 36 | S. |

## PROBLEM II.

*To correct the obſerved Altitude of a Star, or of the Limb of the Sun or Moon, in order to reduce it to the true Altitude of the Center.*

1. Take, out of Table II. the dip of the horizon, which is to be ſubtracted from the obſerved altitude, in order to have the apparent altitude of the ſtar, or of the obſerved limb of the ſun, or moon.

When the land intervenes in the obſervation of the altitude, the dip will be found either by Table III, or by the method given in page 4.

2. If it is the ſun, find, by the Nautical Almanac, the ſemidiameter for the given day, and add it to, or ſubtract it from, the apparent altitude of the obſerved limb, according as it is the lower or the upper; which will give the apparent altitude of the center *.

If it is the moon, find by the Nautical Almanac, the horizontal ſemidiameter and parallax, for the given time at the ſhip (reducing it to the correſponding time at Greenwich). And, with the horizontal ſemidiameter, take out of Table VII. the ſemidiameter anſwering to the apparent altitude of the limb: this ſemidiameter muſt be added to, or ſubtracted from, the ſaid apparent altitude, according as the obſerved is the lower or the upper limb, in order to have the apparent altitude of the center.

3. The corrections to be applied to the apparent altitude already found, in order to conclude the true altitude, will be found by means of Table IV. for a ſtar, or for the ſun; or, by means of Table IX, for the moon, (according to the horizontal parallax found before); uſing for argument the altitude corrected of dip only (that is, in caſe of the ſun, the apparent altitude of the obſerved limb): and the corrections are to be added, or ſubtracted, as ſpecified at the top of the reſpective tables.

* The ſemidiameter, as given by the Nautical Almanac, ought to be reduced by the contraction which proceeds from the difference of refraction (Table VIII.) at the limb and center, in order to have with accuracy the apparent altitude of the latter; but this correction may generally be neglected, and can only produce ſenſible errors in very low altitudes.

SCHOLIUM.

The inverſe problem, that of deducing the apparent altitude * of a ſtar, or of the ſun or moon, from the true altitude, will be ſolved by a proceſs, which is the inverſe of the preceding rule 3. Thus the correction taken out of Table IV, for a ſtar, or for the ſun, is to be added to, and the correction taken out of Table IX, for the moon to be ſubtracted, from the true altitude. This, however, will only give at firſt an approximated altitude; but the exact apparent altitude may be obtained by repeating the ſame operation, taking a ſecond time the correction of Table IV, or IX, for the approximated altitude, and applying it to the true altitude.

REMARK.

The preceding Rules will be illuſtrated in ſeveral Examples of the following Problems.

## PROBLEM III.

*To determine the Azimuth of the Sun, by means of its obſerved Altitude.*

1. Find, by the Nautical Almanac, the ſun's declination, for the time of the obſervation (Problem I.); and deduce the diſtance from the ſun to the elevated pole †.

2. Correct the obſerved altitude of the ſun (Problem II).

3. Add together the ſun's polar diſtance, the ſun's altitude, and the ſhip's latitude; take half the ſum, and the difference between the half-ſum and the polar diſtance.

4. Add together the logarithmic ſecant of the altitude, the logarithmic ſecant of the latitude, the logarithmic coſine of the half-ſum, and the logarithmic coſine of the difference; the ſum (reducing the index to the units) will be the logarithmic verſed of the azimuth, reckoned from that quadrant of the meridian where the elevated pole is ſituated.

SCHOLIUM.

This problem is uſeful in determining the magnetic variation, by obſerving the altitude of the ſun, at the time when its azimuth is taken with the compaſs, and comparing this obſerved azimuth with the computed azimuth, in the manner explained with regard to the amplitudes (pages 13, 14 and 15).

For this purpoſe, it will be ſufficient to make the calculation, neglecting the ſeconds of the data, as follows.

EXAMPLE.

July 6, 1792, in 28°. 30′ north latitude, and 42°. 21′ weſt longitude, at 19$^{h}$. 42$^{m}$ eſtimated time, the altitude of the ☉'s lower limb was obſerved (to the eaſt) to be 9°. 58′. 45″, the eye being raiſed 16 feet above the ſea. The azimuth by the compaſs, obſerved at

* When we ſimply expreſs the apparent, or the true altitude, of the ſun, or moon, we mean the apparent, or true altitude of the center.

† The ſun's polar diſtance (that is, the diſtance to the elevated pole) will be had by taking the complement to 90° of the ſun's declination, when the latitude is of the ſame name; or by adding 90° to the declination, when the latitude is of different name.

the

the ſame time, was 87° S. E. What are the ⊙'s azimuth, and the variation of the compaſs?

| | | | | |
|---|---|---|---|---|
| Eſtimated time at the ſhip | | | | 19h. 42m. 0s |
| Longitude | | | | + 2 . 49 . 24 W. |
| Time at Greenwich | | | | 22 . 31 . 24 |
| ⊙'s declination then (by Nautical Almanac) | | | | 22°. 31′ |
| Obſerved altitude of ⊙'s lower limb | 9°. 59′ | | | |
| Dip | — 4 | | | |
| | 9 . 55 | | | |
| Semidiameter | + 16 | | | |
| | 10 . 11 | | | |
| Correct. of alt. | — 5 | | | |
| True altitude | 10 . 6 | L. ſec. | 0.00678 | |
| Latitude | 28 . 30 | L. ſec. | 0.05610 | |
| ⊙'s polar diſtance | 67 . 29 | | | |
| Sum | 106 . 5 | | | |
| Half-ſum | 53 . 2 | L. cos. | 9.77913 | |
| Half-ſum — pol. diſtance | 14 . 27 | L. double cos. | 9.98604 | |
| Azimuth | | L. ſuv. (ſum) | 9.82805 | —69°. 45′ N.E. |
| Azimuth by compaſs | | 87° S.E. or | | 93 . 0 N.E. |
| Variation of the compaſs | | | | 23 . 15 N.W. |

## PROBLEM IV.

*To find the Latitude of a Ship at Sea, by the obſerved Meridional Altitude of the Sun's Limb.*

1. With the ſhip's longitude, find by the Nautical Almanac the ſun's declination for noon at the ſhip; that is, for the time of obſervation (Problem I, 4).

2. Reduce the obſerved altitude to the true altitude of the center (Problem II).

3. Deduce the ſun's meridional zenith diſtance (the complement to 90° of the altitude), and call it north, or ſouth, according as the ſun is to the north, or ſouth, of the obſerver, at the time of making the obſervation. Take the difference, or the ſum of the meridional zenith diſtance and declination, according as they are of the ſame name, or of different names*; and the reſult will be the latitude of the ſhip required.

The latitude will always be of the name of the declination, except when the declination is of the ſame name, but leſs than the meridional zenith diſtance, in which caſe the latitude will be of a contrary name.

### SCHOLIUM.

The ſun, as well as the moon and ſtars, may paſs ſucceſſively, and without ſetting, by two different points of the meridian. The above rules will then be ſufficient for the

* The name in this acceptation relates to the diſtinction of the zenith diſtance, declination, &c. into north or ſouth.

upper paſſage; but if the ſun was obſerved at its leaſt altitude (between the elevated pole and the horizon), the latitude will be found, by adding together the meridional zenith diſtance and the declination, and taking the ſum from 180°.

EXAMPLE.

March 12, 1792, a ſhip being in 53°. 10′ longitude weſt, the meridional altitude of the ſun's lower limb was obſerved (to the ſouth) to be 86°. 10′. 15″; the obſerver's eye was 17 feet above the ſurface of the ſea: What is the latitude of the ſhip?

| | | |
|---|---|---|
| Obſerved altitude of ⊙'s lower limb | | 86°. 10′. 15″ S. |
| Dip | − | 4. 4 |
| Apparent altitude of the lower limb | | 86. 6. 11 |
| Semidiameter | + | 16. 8 |
| Apparent altitude of the center | | 86. 22. 19 |
| Correction of app. alt. | − | 3 |
| True altitude | | 86. 22. 16 |
| Zenith diſtance (complement to 90°) | | 3. 37. 44 |
| Declination (by Nautical Almanac) | | 2. 51. 29 S. |
| Latitude required (difference) | | 0. 46. 15 N. |

## PROBLEM V.

*To find the Latitude of a Ship at Sea, by the obſerved Meridional Altitude of a Star.*

Find the declination of the Star for the given time, by Table XXV. (See page 10). Correct the altitude, and proceed in the remainder of the operation, according to the rules laid down in the laſt problem.

EXAMPLE.

September 3, 1792, in a ſhip at ſea the meridional altitude of *Fomalhaut* was obſerved (to the ſouth) to be 74°. 19′. 45″, the obſerver's eye being 19 feet above the ſurface of the ſea: What is the latitude of the ſhip?

| | | |
|---|---|---|
| Obſerved altitude of *Fomalhaut* | | 74°. 19′. 45″ S. |
| Dip | − | 4. 17 |
| Apparent altitude | | 74. 15. 28 |
| Correction of app. alt. | − | 16 |
| True altitude | | 74. 15. 12 |
| Zenith diſtance (complement to 90°) | | 15. 44. 48 |
| Declination (by Table XXV.) | | 30. 42. 51 S. |
| Latitude (difference) | | 14. 58. 3 S. |

PROBLEM

## PROBLEM VI.

*To find the Latitude of a Ship at Sea by the observed Meridional Altitude of the Moon's Limb.*

1. Find by the Nautical Almanac the time of the moon's paſſing the meridian of Greenwich, on the given day: and take the difference between that time and the time of the preceding paſſage, if the ſhip's longitude is eaſt; or the difference between the ſaid paſſage and the following paſſage, if the longitude is weſt.

With that difference, as variation, and the ſhip's longitude, find (by Table XLIII.) the proportional part; and add it to, or ſubtract it from, the paſſage at Greenwich, according as the longitude is weſt or eaſt; and the ſum, or difference, will be the time at the ſhip, when the moon paſſed the meridian, that is, when the obſervation was made.

If the time at the ſhip, when the obſervation was made, is well known, the above calculation may be omitted.

2. For the ſaid time (reduced to that at Greenwich), find by the Ephemeris the moon's horizontal ſemidiameter, horizontal parallax, and declination.

3. Correct the obſerved altitude (Problem II), and conclude the latitude, following the rules in Problem IV.

### EXAMPLE.

February 19, 1792, in longitude 157°. 13′ eaſt, the meridional altitude of the moon's upper limb was obſerved (to the north) to be 82°. 7′. 30″, the obſerver's eye being 20 feet above the ſurface of the ſea: What is the latitude of the ſhip?

| | | |
|---|---|---|
| Time of ☾'s paſſage at Greenwich, Feb. 19 - - | 22ʰ. 22ᵐ | |
| Diff. to the preceding paſſage — 58ᵐ. Prop. part to 157°. 15′ — | 25 . 20 | |
| Time at the ſhip - - - - - | 21 . 56 . 40 | |
| Longitude eaſt 157°. 13′ = - - - - — | 10 . 28 . 52 | |
| Time at Greenwich - - - - - | 10 . 27 . 48 | |
| By Nautical Almanac then ☾'s horizontal ſemidiameter | 16′ . 21″ | |
| By Nautical Almanac then ☾'s horizontal parallax - | 60 . 1 | |
| By Nautical Almanac then ☾'s declination - - | 15°. 29 . 41 | S. |
| Obſerved altitude of ☾'s upper limb - - - | 82 . 7 . 30 | N. |
| Dip - - - - - - - - — | 4 . 24 | |
| Apparent altitude of upper limb - - - | 82 . 3 . 6 | |
| Semidiameter in altitude - - - - — | 16 . 38 | |
| Apparent altitude - - - - - | 81 . 46 . 28 | |
| Correct. of app. alt. - - - - + | 8 . 27 | |
| True altitude - - - - - | 81 . 54 . 55 | |
| Zenith diſtance (complement to 90°) - - | 8 . 5 . 5 | |
| Declination - - - - - - | 15 . 29 . 41 | S. |
| Latitude of the ſhip required - - - - | 23 . 34 . 46 | S. |

## PROBLEM VII.

*To find the Latitude of a Ship at Sea, by ſeveral Altitudes of the Sun obſerved near Noon.*

1. By obſerved altitudes of the ſun (Problem IX), or by ſome other way, let the watch be compared with apparent time, when it may be practicable, or convenient, in order to determine the time, which the watch will mark, or has marked, at the moment of noon at the ſhip.

2. Add the obſerved altitudes together; and divide the ſum by their number, in order to have the mean obſerved altitude.

3. Take the differences between the time of noon by the watch, and the time of the obſervation of each altitude. Find in Table XXIV. the multiplier for each difference, or interval; add all the multipliers together, and divide the ſum by their number, in order to have the mean multiplier.

4. Find, by the Nautical Almanac, the ſun's declination for noon (Problem I): with which, and the latitude by account, take the correſponding number out of Table XXIII. and multiply it by the mean multiplier. The product, and the mean altitude, added together, will be the obſerved meridional altitude; from which the latitude may be eaſily concluded (Problem IV).

### EXAMPLE.

March 7, 1792, in latitude 18°. 45′ N. by account, and longitude 111°. 34′ W. the apparent time was determined by the ſun's altitude; from which it was found, that the watch was then 15′ too ſlow for apparent time, under that meridian. The ſhip afterwards ſailed, and made 13′ of latitude to the ſouth, and 1°. 56′ of longitude to the weſt. In this ſituation (latitude 18°. 32′, and longitude 113°. 30′) the four following altitudes of the ſun's lower limb were obſerved, the eye being 13 feet above the ſea: What is the ſhip's latitude?

| | Obſerved altitudes of ⊙'s lower limb. | Times by watch. |
|---|---|---|
| | 73 . 59 . 15″ | 12 . 3 . 53 |
| | 74 . 0 . 0 | 12 . 5 . 41 |
| | 74 . 1 . 0 | 12 . 7 . 12 |
| | 74 . 1 . 30 | 12 . 11 . 13 |
| Sum | 296 . 1 . 45 | |
| Mean altitude (dividing by 4) | 74 . 0 . 26 | |

| | |
|---|---|
| The watch is too ſlow in longitude 111°. 34′ W. | 15′ |
| Ship's difference in longitude W. 1°. 56′ = | 7ᵐ. 44 |
| Therefore, in longitude 113°. 30′, the watch is too faſt | 7 . 29 |
| And at noon the time ſhewn by the watch will be | 12 . 7 . 29 |
| ⊙'s declination at noon (by Nautical Almanac) | 4°. 45′ . 7″ S. |

| Time of Noon by Watch. | Times of the Observations by Watch. | | Intervals. | |

| True meridion. altitude | | | - - - | 74. 13. 23 |
| Zenith distance (complement to 90°) | | | - - | 15. 46. 37 |
| Declination - - - - - | | | | 4. 45. 7 |
| Latitude of the ship required | | | - - - | 20. 31. 44 |

REMARK.

For greater accuracy, the operation might be repeated, using the latitude already found, instead of the latitude by account, but the error of the first result will generally be inconsiderable.

## PROBLEM VIII.

*To find the Latitude of a Ship at Sea, by two observed Altitudes of the Sun, and the Interval of Time elapsed between the Observations.*

1. Correct the two observed altitudes which are to be employed in the calculation (Problem II).

2. Subtracting the time, by the watch, of the first observation, from the time of the second observation (increased by 12h, if necessary), the remainder will be the interval, or time elapsed *.

3. Find, by the Nautical Almanac, the sun's declination for the middle time, (taken in an approximate manner), between the two observations.

4. According to the data, find by Tables XXI, and XXII, the respective side, and angle, encreasing this by 90°.

5. Add together that side, and the two altitudes; take half the sum, and the difference between the half-sum and the greater altitude.

* If the motion of the watch, in twenty-four hours, differs considerably from true time, it will be proper to correct the interval, or time elapsed, by the proportional part of the rate.

6. Take

6. Take the logarithmic cofecant of the fide, the logarithmic fecant of the leffer altitude, the logarithmic cofine of the half-fum, and the logarithmic fine of the difference; the fum (reducing the index to the units) will be the logarithmic verfed of arch B.

7. When the fun's declination is of the fame name, and leſs than the latitude (which muſt be eſtimated, or found by the dead reckoning for that purpoſe), take the fum of arch B. and the angle of Table XXII. encreaſed by 90°.; in all other caſes take their difference.

8. Take the difference between the fun's declination and the leſſer altitude.

9. Take the logarithmic fuverſed of the above fum, or difference (Rule 7), the logarithmic cofine of the leſſer altitude, the logarithmic cofine of the declination, and the arithmetical complement of the logarithmic fuverſed * of the difference (Rule 8); look for the fum (reducing the index to the units) in the logarithmic verſed, and take out the correſponding logarithmic fuverſed (that is, the one anſwering to the fame argument); ſubtract from this the preceding arithmetical complement; and looking for the remainder in Table XVII, the correſponding argument, leſs than the quadrant, under the head coverſed, or ſucoverſed, will be the latitude of the ſhip required.

*N.B.* That computed latitude will be the latitude of the ſhip at the place where the obſervations were made; and muſt be reduced to noon, or any other time, by means of the log.

EXAMPLE.

June 10, 1795, in the afternoon, latitude by account 81°. 30′ N. longitude 47°. E. at 9h. 33m. 8s by the watch, the altitude of the ſun's lower limb was obſerved to be 16°. 3′. 15″ and at 11h. 16m. 48s the altitude of the ſame limb was 14°. 36′. 15″; the height of the obſerver's eye being 17 feet above the ſurface of the ſea: What was the latitude of the ſhip?

| | 1ſt. Obſ. | 2d. Obſ. |
|---|---|---|
| Alt. ⊙'s L.L. | 16°. 3′. 15″ | 14°. 36′. 15″ |

* The arithmetical complement of a logarithm is found by taking the complement to 9 of every figure, except the laſt, of which the complement to 10 is to be taken. This may be done by memory at the ſight of the table.

SCHOLIUM.

SCHOLIUM.

In the preceding Rules and Example, it has been ſuppoſed that both altitudes were taken at the ſame place. That can ſeldom happen at ſea: but the change of ſituation may be attended to, by reducing one of the altitudes to what it would have been, if obſerved at the ſame place where the other was, as follows:

Let the bearing of the ſun be obſerved by the compaſs, at the inſtant of the firſt obſervation: take the number of points between it and the ſhip's courſe, corrected for lee-way, if ſhe makes any: with which, if leſs than 8 points, or with what it wants of 16 points, if more than 8, and the diſtance run between the obſervations, enter the Traverſe Table, and take out the difference of latitude correſponding to them. Add this difference of latitude to the firſt altitude, if the number of points between the ſun's bearing and the ſhip's courſe were leſs than 8, but ſubtract it from the firſt altitude if the number of points were more than 8; and it will be reduced to what it would have been if obſerved at the ſame place where the ſecond was.

*Note.* The reſult of the operation will then be the latitude of the ſhip, at the time when the ſecond altitude was obſerved.

EXAMPLE.

May 3, 1795, being at ſea, in longitude 4° W. and latitude 27°. 20′ S. by account, at 5ʰ. 19ᵐ. 14ˢ by the watch, the obſerved altitude of the ſun's lower limb was 47°. 1′, and the azimuth of the ſame by compaſs, N.N.E. ½ E. and at 1ʰ. 14ᵐ. 39ˢ, the obſerved altitude of the ſame limb was 44°. 6′ ½. The ſhip's courſe between the obſervations was N. by W. ½ W. on the ſtarboard tack, at the rate of 6 knots, and ſhe made ½ of a point lee-way: What was the true latitude, the height of the obſerver's eye being 20 feet?

| | |
|---|---|
| Ship's courſe by comp. | N. 1 ¾ W. |
| Lee-way - - | ¼ |
| Ship's courſe corrected | N. 2 ½ W. |

REMARKS.

REMARKS.

The preceding calculations have been made, neglecting the ſeconds of the circle, and Tables XXI, and XXII, have been arranged for computing in that manner; becauſe the operation is thus eaſier, and the reſult will give the latitude generally within one minute, which is ſufficient for the uſual purpoſes of Navigation.

The problem of finding the latitude by two altitudes of the ſun, is of great importance in practice; but the proper uſe of it requires many attentions and precautions, which I could not ſufficiently explain within the limits of this introduction. I ſhall enlarge upon them in my Treatiſe on Navigation; contenting myſelf, at preſent, with the following remarks concerning the obſervations.

When the knowledge of the latitude is neceſſary for the ſafety of the ſhip, it would be imprudent to truſt to the obſervation of the Sun's meridional altitude, which the weather may render impracticable. In ſuch caſes, the Sun's altitude may be obſerved ſeveral times during the day; and this attention will be the more indiſpenſable, if the weather is cloudy or unſettled, in which circumſtances it will be uſeful to take the altitude whenever the Sun appears, or the obſervation is advantageous. The following Rules are intended to direct the choice of proper circumſtances for making the obſervations, and likewiſe for determining, among ſeveral obſervations, thoſe which are preferable for the accuracy of the reſult*.

1. It will be always advantageous to have an altitude taken near noon. Thus, among ſeveral obſerved altitudes, the greateſt is always to be adopted for one, and the choice of the other may be determined by the following conſiderations:

2. When two altitudes were obſerved on different ſides of the meridian (that is, one altitude before, and the other after, noon), it will be proper that the leſſer altitude be likewiſe obſerved near noon. Beſides, the interval of time between noon and the time of each obſervation, muſt not exceed the *time from noon* in Table XXVIII, anſwering to the ſhip's latitude by account, and the ſun's declination at that time, which may be found by the Nautical Almanac.

If the above circumſtances take place, the obſervations on different ſides of the meridian will be preferable to the obſervations on the ſame ſide.

3. When two altitudes correſpond to the ſame ſide of the meridian, it will be advantageous that the leſſer altitude be obſerved at an interval of time from noon, greater than the *time from noon* given in Table XXVIII.

In that rule we muſt, however, except the caſes, when the ſun, in its diurnal motion, paſſes between the zenith and the elevated pole. Then, it will be proper that one of the altitudes be obſerved at the ſame time from noon as that given in Table XXVIII.

4. Two altitudes may be ſo ſituated as to render the determination of the latitude, by them, either impoſſible, or liable to great errors. It will then be neceſſary, either to abandon the inveſtigation altogether, or to proceed in it with care and caution. For this reaſon, a preliminary examination may be made to aſcertain the nature of the caſe as follows.

With the time elapſed between the obſervations, and the complement to 90° of the actual declination of the ſun, take the correſponding ſide of Table XXI. and the caſe will be impoſſible, or unfavourable, if this ſide equals, or differs but little, from the

* Dr. Maſkelyne thinks, that the watch ought to go at leaſt within an error of four minutes in four-and-twenty hours.

difference between the true altitudes, or from the complement to 180° of the ſum of the altitudes.

The above diſadvantage is unavoidable, when the ſun, in its diurnal motion, paſſes the meridian at the zenith, or near the zenith.

It ſeems unneceſſary to add, that the interval of time may be more or leſs extended, according to the degree of confidence which may be had in the watch during that time. A watch may be too bad for this purpoſe, and a good one may enable the obſerver to aſcertain the latitude with ſufficient accuracy in circumſtances otherwiſe diſadvantageous.

## PROBLEM IX.

*To find the apparent Time by the obſerved Altitude of the Sun's Limb.*

1. With the ſhip's longitude and the eſtimated apparent time, find, by the Nautical Almanac, the ſun's declination for the moment of the obſervation (Problem I.).

2. From the obſerved altitude of the limb, deduce the true altitude of the center (Problem II.).

3. From the ſun's declination, conclude the polar diſtance (*Note* to Problem III.), and add it together with the ſhip's latitude, and the altitude; take half the ſum, and the difference between the half-ſum and the altitude.

4. Take the logarithmic coſecant of the polar diſtance, the logarithmic ſecant of the latitude, the logarithmic coſine of the half-ſum, and the logarithmic ſine of the difference. The ſum (with the index reduced to the units) will be the logarithmic verſed of the time from noon (or the ſun's horary angle), when the altitude was obſerved.

5. The time from noon is the apparent time, if the altitude was obſerved to the weſt, or in the afternoon; but, if it was obſerved to the eaſt, or in the forenoon, the time from noon muſt be taken from 24ʰ, in order to have the apparent time of the preceding day.

EXAMPLE.

February 11, 1792, in latitude 23°. 20′ ſouth, and longitude 27°. 27′ weſt, the altitude of the ſun's lower limb was obſerved (to the eaſt) to be 45°. 16′. 15″, the obſerver's eye being 14 feet above the ſurface of the ſea. The eſtimated time was then 20ʰ. 57ᵐ. 30′ (8ʰ. 57ᵐ. 30′ in the morning by the watch). What is the apparent time at the ſhip, at the moment of the obſervation?

| | | | |
|---|---|---|---|
| Eſtimated time at the ſhip, Feb. 11 | | | 20ʰ. 57ᵐ. 30′ |
| Longitude W. 27°. 27′ = | | | + 1. 49′. 48 |
| Time at Greenwich | | | 22. 47. 18 |
| The true altitude will be found to be | | | 45°. 21′. 53″ |
| ☉'s declin. (by Naut. Almanac) | S. 13°. 41′. 36″ | | |
| Polar diſtance | 76. 18. 24 | L. coſec. | 0.01252 |
| Latitude | 23. 20. 0 | L. ſec. | 0.03706 |
| Altitude | 45. 21. 53 | | |
| Sum | 145. 0. 17 | | |
| Half-ſum | 72. 30. 8 | L. coſine | 9.47804 |
| Half-ſum — alt. | 27. 8. 15 | L. ſine | 9.65909 |
| Time from noon | 3ʰ. 4ᵐ. 40′ | L. verſ. (ſum) | 9.18671 |
| Apparent time required | 20. 55. 20 | | |

REMARK.

## PROBLEM X.

*To find the apparent Time by the obſerved Altitude of a Star.*

1. Find the right aſcenſion and declination of the ſtar, for the given time by the catalogue.

2. Reduce the obſerved altitude to the true (Problem II.).

3. With the ſtar's declination and true altitude, and the ſhip's latitude, compute the ſtar's horary angle (or diſtance from the meridian), following rules 3 and 4 of Problem IX.

4. When the altitude was obſerved to the weſt, take the ſum of the horary angle, and the ſtar's right aſcenſion: when it was obſerved to the eaſt, ſubtract the horary angle from the right aſcenſion, increaſing this by 24, if neceſſary: the ſum (deducting 24 if greater than this quantity), or remainder, will be the right aſcenſion of mid-heaven.

5. Take out of the Nautical Almanac, the right aſcenſion for noon of the given day; and its variation during the 24 hours which comprehend the time of obſervation.

6. If the apparent time at Greenwich, at the moment of the obſervation, is accurately known (as in the caſe of Example II. to Problem XIII.), find, (Problem I.), the ſun's right aſcenſion for that moment; and ſubtract it from the right aſcenſion of mid-heaven (increaſed by $24^h$, if neceſſary); and the remainder will be the apparent time at the ſhip required.

If the apparent time at the ſhip is not well known, it will be neceſſary to proceed according to the following rules.

7. Subtract the ſun's right aſcenſion for noon, from the right aſcenſion of mid-heaven (increaſed by 24 hours, if neceſſary); and the remainder will be the approximated apparent time at the ſhip.

8. With the difference of longitude, find the correſponding time at Greenwich; and take the interval between it and the noon before. Find the proportional part of the variation of the right aſcenſion to this interval; and add it to, or ſubtract it from the approximated time at the ſhip, according as the corresponding time at Greenwich is before or after the ſaid noon; the ſum, or difference, will be the time required.

### EXAMPLE.

March 1, 1792, at $9^h.\ 32^m.\ 9^s$, time eſtimated by means of the watch, latitude 28°. 7′ north, and longitude 56°. 0′ weſt, the altitude of *Aldebaran* was obſerved (to the weſt) to be 32°. 11′. 45″, the obſerver's eye being 16 feet above the ſurface of the ſea: What is the apparent time at the ſhip when the obſervation was made?

The

## PROBLEM XI.

*To find the true, or the apparent Altitude, of the Sun, for a given Time and Place.*

1. Find, by the Nautical Almanac, the ſun's declination for the given time (Problem I.); from which, and the ſhip's latitude, deduce the meridional zenith diſtance (Problem IX. 3).

2. The interval between noon, and the given time, will be the time from noon, or the ſun's horary angle.

3. Add together the logarithmic verſed of that horary angle, the logarithmic coſine of the ſun's declination, the logarithmic coſine of the latitude, and the logarithmic ſecant of the meridional zenith diſtance: look for the ſum in the logarithmic verſed, and take out the correſponding logarithmic ſecant (or that which anſwers to the ſame argument); add it to the logarithmic ſecant of the meridional zenith diſtance; and the ſum will be the logarithmic coſecant of the ſun's true altitude.

The altitude will be negative, or the reſult will ſhew how much the ſun is under the horizon, if the firſt ſum anſwers to an arch exceeding 90°, in the logarithmic verſed-ſines.

4. The apparent altitude, if wanted, may be concluded from the true altitude (Scholium to Problem II.).

### EXAMPLE.

May 4, 1792, at $3^h.\ 10^m.\ 4^s$, in latitude $42°.\ 20'$ north, and longitude $14°.\ 18'$ weſt: What was the ſun's true altitude?

| | | | | | |
|---|---|---|---|---|---|

## PROBLEM XII.

*To find the true Altitude of the Moon, or of a Star, for a given Time and Place.*

1. Find the right aſcenſion and declination of the moon (by the Nautical Almanac), or of the ſtar (by Table XXV.) for the given time.

2. Find, by the Nautical Almanac, the ſun's right aſcenſion then, and add it to the given time; the ſum (or its exceſs above 24) will be the right aſcenſion of mid-heaven, and the difference between this and the right aſcenſion of the moon, or ſtar, will be the horary angle of the ſame.

3. With the moon's, or the ſtar's, horary angle, and declination, and the ſhip's latitude, the true altitude may be computed by the rules laid down in the preceding problem.

4. From the true altitude, the apparent altitude, if neceſſary, may be concluded (Scholium to Problem II.).

REMARK.

This calculation is illuſtrated in the example to the following problem, Scholium II.

## PROBLEM XIII.

*To find the Longitude of a Ship at Sea, by the diſtance from the Moon's Limb to the Sun's Limb, or to a Star, and the Altitudes of the ſame heavenly Bodies, obſerved at the ſame Time*.*

1. With the eſtimated time at the ſhip, and the longitude by account, conclude the eſtimated time at Greenwich; and find by the Nautical Almanac, for that time, the ſun's declination and ſemidiameter, the moon's horizontal ſemidiameter and parallax; and the other elements which may be neceſſary for the calculation, if the diſtance is to a ſtar (Problem I.).

2. From the obſerved altitudes, conclude the apparent altitudes of the center (Problem II.), to the neareſt minute only.

3. Add to, or ſubtract from, the obſerved diſtance, the moon's ſemidiameter in altitude (taken out of Table VII. with the horizontal ſemidiameter found by the Ephemeris), according as the contact was obſerved with the neareſt or the fartheſt limb. If the diſ-

* It will be proper to obſerve, within a very ſhort time, ſeveral diſtances, as well as ſeveral altitudes, in order to uſe the mean of each ſet, as well as that of the correſponding times marked by the watch. The mean of ſeveral quantities is found by adding them all together, and dividing the ſum by their number.

tance

tance is to the ſun, do the ſame with its ſemidiameter (taken out of the Ephemeris); and the reſult will be the apparent diſtance of the centers.

4. Add together the two apparent altitudes.

5. Take out of Table VI. the complementary correction anſwering to the apparent altitude of the ſun or ſtar; and out of Table IX. the correction of the moon's apparent altitude, according to the minutes of horizontal parallax, and the proportional parts for ſeconds; which add together with the ſum of apparent altitudes, and you will have the corrected ſum of altitudes.

At the time of taking the correction of Table IX. take likewiſe the Auxiliary Argument out of Table X. which will be found in the oppoſite page.

6. Take out of Table XI. Number I. anſwering to the ſum of apparent altitudes and to the minutes of auxiliary angle, and alſo the parts for ſeconds; Number II. anſwering to the ſum of corrected altitudes, and the parts for ſeconds; and Number III. anſwering to the degrees and minutes of apparent diſtance (reſerving the ſeconds) and the minutes of auxiliary argument, and alſo the parts for ſeconds. Add together the three numbers, and parts for ſeconds; and the corrected diſtance anſwering to that ſum in the ſame Table, with the addition of the reſerved ſeconds, will be the true diſtance from the moon to the ſun, or ſtar *.

7. Look, in the Nautical Almanac, for the two correſponding diſtances which comprehend the computed true diſtance; and take their difference, as well as the difference between the firſt of them and the true diſtance. Take the proportional logarithms of theſe two differences, deduce their difference; and look in the proportional logarithms for the correſponding hours, minutes, and ſeconds. Theſe, added to the hour of the firſt diſtance, taken out of the Nautical Almanac, will give the apparent time at Greenwich when the obſervation was made.

8. By the altitude of the ſun or ſtar, and the other data, compute the apparent time then at the ſhip (Problems IX. and X.).

9. The difference (turned into degrees and minutes) between that apparent time, and the apparent time at Greenwich, found before, will be the longitude of the ſhip when the diſtance was obſerved; and the longitude will be eaſt or weſt, according as the time at the ſhip is greater or leſs than the time at Greenwich.

### REMARK.

We have ſuppoſed that the diſtance and the altitudes are obſerved at the ſame time: this requires three obſervers, but a ſingle one may apply the help of aſſiſtants, by obſerving ſome altitudes before and after the obſervations of the diſtances, and marking the time of each by the watch, from whence the altitudes of the moon, and of the ſun, or ſtar, anſwering to the diſtance, may be deduced by applying the variations which are proportional to the intervals.

### EXAMPLE I.

April 18, 1793, about half an hour paſt three o'clock, latitude 0°. 31′ S. longitude by account 9° W. the following obſervations were made, for finding the true longitude of

* Remark that, after taking Number I., Number II. will be found on turning one or two leaves, and that if the book is left open at the place of Number III. the corrected diſtance for the ſum will be found in the ſame or the contiguous; ſo that two ſearchings into the table will be ſufficient for this part of the calculation.

the

the ship; the height of the observer's eye being 20 feet above the surface of the sea. Note, 14″ must be subtracted from the distance, and 1′. 9″ added to the sun's altitude, for the errors of the quadrants.

### SCHOLIUM I.

In the preceding rules we find the apparent time at the ſhip, when the diſtance was obſerved by means of the ſun's altitude, obſerved at the ſame time: but the apparent time may likewiſe be aſcertained by means of an altitude taken before or after, in order to know the error of the watch in the meridian of that obſervation. Allowing for that error, as well as for a proportional part of the rate of the watch in the interval, if both are conſiderable, the apparent time at the moment of obſerving the diſtance will be eaſily

concluded; and, by comparing it with the apparent time at Greenwich, as explained before, the result will be the longitude of the place, where the altitude for aſcertaining the apparent time was obſerved.

In ſuch caſes the ſun's altitude may be obſerved in the circumſtances moſt advantageous for determining the time, either before or after the obſervation of the diſtance. This method will be particularly uſeful, when the ſun's altitude, obſerved with the diſtance, is diſadvantageous, and when the diſtance is to a ſtar, as the obſerved altitude may then produce conſiderable error in the computed time, though it may be ſufficiently accurate for the calculation of the true diſtance.

EXAMPLE I.

December 6, 1793, latitude 53°. 29′ S. longitude 170° W. by account, about 20$^{h}$. 20$^{m}$, the following altitudes of the ſun's lower limb were obſerved: What was the error of the watch which ſhewed the times that ſtand againſt them? The height of the obſerver's eye was 20 feet; and 3′. 11″ muſt be ſubtracted from the altitudes for the error of the quadrant.

## SCHOLIUM II.

We have ſuppoſed, till now, that the altitudes for the reduction of the diſtance are actually obſerved; but if theſe obſervations cannot be made, or from the time of night, or imperfect light of the horizon, can only be made under diſadvantageous circumſtances, the true and apparent altitudes may be computed (Problems XII. and XIII.), and with them the longitude will be concluded, following the preceding rules.

## EXAMPLE.

July 26, 1792, in latitude 29°. 57′ north, about 6h. 8m eſtimated time, and longitude by account 113°. 50′ weſt, the following obſervations were made, the obſerver's eye being 17 feet above the ſurface of the ſea, in order to aſcertain the error of the watch; and it was known that it went 8s too faſt in 24 hours. Note, 15″ is to be ſubtracted for the error of the quadrant.

| Times by the watch. | Altitude of ⊙'s L. L. | |

## REMARK.

The correction used, to deduce the moon's apparent altitude from its true altitude, is the same as must be included afterwards in the addition which gives the corrected sum of altitudes; and the auxiliary argument may be taken out of Table X. at the same opening of the book. The complementary correction of sun or star's altitude, included likewise in that addition, is the complement to 1° of the correction used for the deduction of the true altitude, and may be had by taking the complement at sight, without looking into Table VI. for that purpose.

THE END.

T. Bensley, Printer,
Bolt Court.

C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments
and Numbers III. for Apparent Distances - - - - - }

Sums for finding the Corrected Distance.

C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Dif. ---------- }

Sums for finding the Corrected Diftances.

| Diff. | Auxiliary Arguments. | | |

Numbers II. for Corrected Sums of Altitudes.

Numbers I. for Sums of Apparent Altitudes and Numbers III. for Apparent Distances ----- } and Auxiliary Arguments.

C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Distances - - - - - }

Sums for finding the Corrected Distances.

Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Distances - - - - - }

Numbers II. for Corrected Sums of Altitudes.

C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Distances - - - - - }

Sums for finding the Corrected Distance.

Parts for Seconds of Auxil. Additive

Auxiliary Arguments.

# C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
## and Numbers III. for Apparent Distances - - - - - }

Sums for finding the Corrected Distances.

C. T. XI. Numbers I. for Sums of Apparent Altitudes and Numbers III. for Apparent Distances ----- } and Auxiliary Arguments.

Parts for Seconds of Anxil. Argum.

Sums for finding the Corrected Distances.

C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Distances - - - - - - }

Sums for finding the Corrected Distances.

Parts for Seconds of Auxil. Argum. additive

C. T. XI. Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Distances - - - - - }

Sums for finding the Corrected Distances.

Auxiliary Arguments.

C. T. XI. . Numbers I. for Sums of Apparent Altitudes } and Auxiliary Arguments.
and Numbers III. for Apparent Distances - - - - - }

Sums for finding the Corrected Distances.
